

Pangasinan Heritage Destination Explorer

Project Summary

What It Is

A modern travel web app built with Next.js and Tailwind CSS, helping users explore Pangasinan's islands, beaches, natural springs, and historical churches.

Data Structure (pangasinanData.ts)

- Content lives in a dedicated data file, not hardcoded into pages.
- TypeScript interfaces: `AttractionItem` and `AttractionCategory`.
- Destinations grouped into categories: Islands, Coast, Springs, Pilgrimage.
- Each item has a unique ID, title, location, description, and image link.

Category Filtering (page.tsx)

- State: an `activeTab` variable tracks the selected filter (defaults to "all").
- Logic: clicking a button (e.g. Islands) updates `activeTab` to "islands".
- Display: the matching category is found in `pangasinanCategories` and its items shown; "All" combines everything.

Design Vibe

- Deep slate background with glowing emerald ambient blur effects.
- Glassmorphism cards that light up with emerald borders on hover.
- Interactive pill buttons that highlight the active category.
